Complexity:  $C(P)/n$  ?

Naive distribution is not good enough

Synchronization is needed  
(e.g., a counter object)

# Distributed Computation

$C(O,A)$

Figure 1 Diagram of a Turing Machine

Figure 1 Diagram of a Turing Machine

# What complexity?

No contention: 0 step

Contention:  $k$  steps

Node failures:  $n$  steps

Link failures: infinity

# This Talk

Complexity of a computation  $C(P)$

Complexity of a distributed  
computation  $C(P,A)$

from centralized to distributed  
computation

$C(P) \rightarrow C(P, A)$

from distributed computation  
to systems

$C(P, A) \rightarrow C(P, A_1, A_2, \dots, A_n)$

**Polymorphic adversary**

# What complexity?

Polymorphic adversary

$$C(O, A1, A2, A3, A4) = (1, O(k), O(f), \text{infinity})$$

# The Distributed System's Nightmare

## Polymorphic adversary

**Paxos saga**

**STM saga**

# This Talk

Complexity of a computation  $C(P)$

Complexity of a distributed  
computation  $C(P,A)$

Complexity of a distributed system  
 $C(P,A_1,A_2,..A_n)$

# Adversary-Oriented-Computing

**Reduce the pb of addressing several adversaries at a time to the “classical” problem of addressing one adversary at a time**

# **Adversary-Oriented-Computing**

## **Two fundamental questions**

- (1) How to prove polymorphic lower bounds?
- (2) How to develop polymorphic algorithms?

# How to prove polymorphic lower bounds?

Algorithmic reductions of adversaries  
(STOC 05, ..SPAA 12)

K steps with

Can be simulated with

t rounds of a t-resilient synchronous  
algorithm can be simulated by  
a 1-resilient asynchronous algorithm

## Two fundamental questions

(1) How to prove polymorphic lower bounds?

Algorithmic reductions of adversaries

(2) How to develop polymorphic algorithms?

**AOC (PODC00, ..Eurosys 10, PLDI12, Spaa 12)**

Switch(adversary)

Case A1: algorithm\_1();

Case A2: algorithm\_2();

...

Case Ak: algorithm\_k()

...

## *State machine*

# Shared Object

**Safety:** if  $c_1$  delivers history  $h_1$  and  $c_2$  delivers history  $h_2$ , then one is the prefix of the other

**Liveness:** if a correct client  $c$  invokes a request  $req$ , then  $c$  eventually delivers response  $h(req)$

## **AOC Object (A)**

**Liveness (1):** if a correct client  $c$  invokes a request  $req$ , then  $c$  commits or aborts  $h(req)$

**Liveness (2) :**  $h(req)$  is **committed** if the adversary is weaker than  $A$

# AOC Object

**Safety (1):** if  $c_1$  commits history  $h_1$  and  $c_2$  commits  $h_2$ , then one is prefix of the other

**Safety (2):** if  $c_1$  commits history  $h_1$  and  $c_2$  aborts  $h_2$ , then  $h_1$  is prefix of  $h_2$

# Composition Theorem (PLDI 12)

**AOC Object A1 + AOC Object A2**

**=**

**AOC Object (A1 U A2)**

## Two fundamental questions

(1) How to prove polymorphic lower bounds?

Algorithmic reductions of adversaries

(2) How to develop polymorphic algorithms?

Modular/dynamic switching of adversaries

# This Talk (AOC)

Complexity of a computation  $C(P)$

of a distributed computation  $C(P,A)$

of a distributed system  $C(P,A_1,A_2,..A_n)$

## **Adversary-Oriented-Computing**

$C(O,A_1)$        $C(O,A_2)$       ..       $C(O,A_n)$

Thank you for your attention
